

Interactive Visualization of Diffusion Image Data and its Models

Gordon Kindlmann

Laboratory of Mathematics in Imaging
Department of Radiology
Brigham & Women's Hospital
Harvard Medical School

Outline

- Intro to modality
- Single tensor parameters, applications
- Beyond single tensor fit
- Visualization of DWI and model

Diffusion imaging detects anisotropy

Kleenex

newspaper

Anisotropy: directional variation in diffusivity

White Matter fiber bundle
Cross-section:

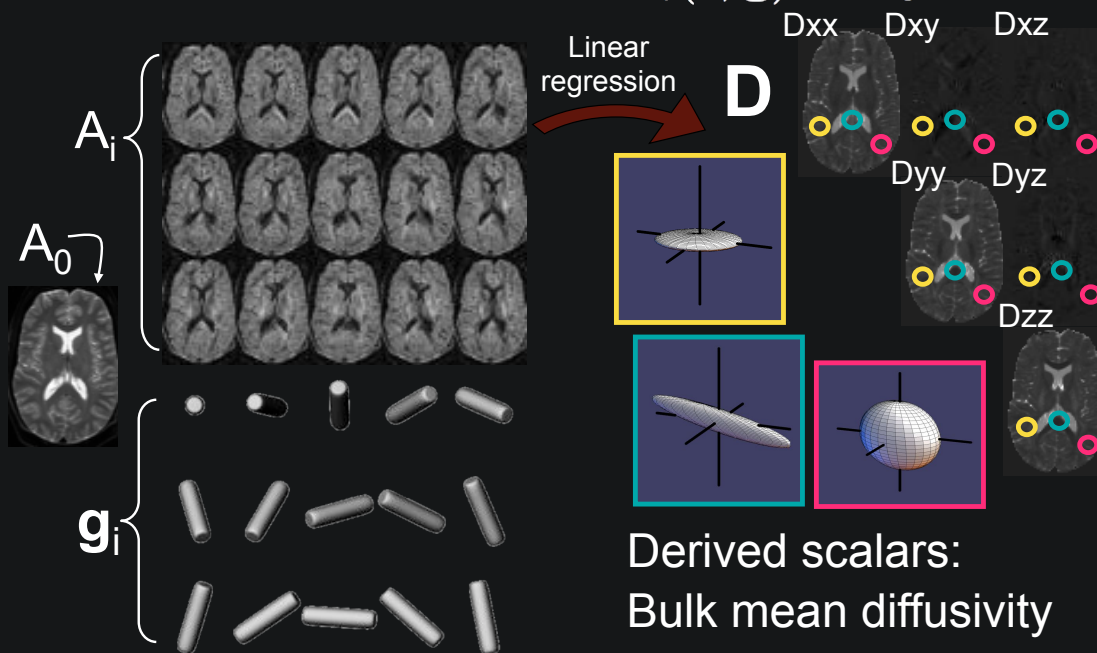

Microstructure of bundles directionally constrains water diffusion along fiber direction (LeBihan et al. 1985)

Diffusion-weighted MRI measures “apparent diffusion coefficient” (ADC) along many directions

Tensors from diffusion-weighted images

Single Tensor Model (Basser 1994) $A_i(b, \mathbf{g}) = A_0 e^{-b \mathbf{g}_i^T \mathbf{D} \mathbf{g}_i}$

Derived scalars:
Bulk mean diffusivity
Fractional Anisotropy FA

Tractography

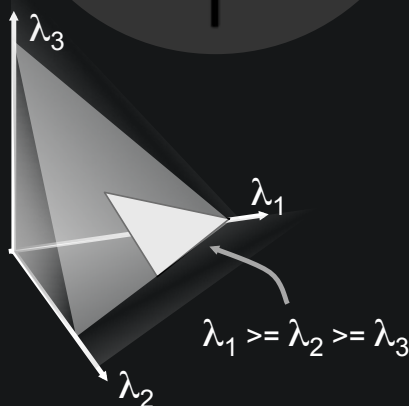

- Path integral of principal eigenvector
- Various parameter settings...

(demo)

Tensor Shape = model parameters

$$\mathbf{D} = \mathbf{R}\mathbf{\Lambda}\mathbf{R}^{-1}$$

$$= \begin{bmatrix} | & | & | \\ \mathbf{v}_1 & \mathbf{v}_2 & \mathbf{v}_3 \\ | & | & | \end{bmatrix} \begin{bmatrix} \lambda_1 & 0 & 0 \\ 0 & \lambda_2 & 0 \\ 0 & 0 & \lambda_3 \end{bmatrix} \begin{bmatrix} - \\ \mathbf{v}_1 \\ - \\ \mathbf{v}_2 \\ - \\ \mathbf{v}_3 \\ - \end{bmatrix}$$

Tensor shape parameterizations

Cylindrical Coordinates: $\{K_i\}$

$$K_1 = \text{tr}(\mathbf{D})$$

$$K_2 = |\mathbf{E}|$$

$$K_2 = \text{mode}$$

$$\text{tr}(\mathbf{D}) = D_{xx} + D_{yy} + D_{zz}$$

$$|\mathbf{D}| = \sqrt{\text{tr}(\mathbf{D}^T \mathbf{D})}$$

$$\mathbf{E} = \text{deviatoric}(\mathbf{D})$$

$$= \mathbf{D} - \text{trace}(\mathbf{D}) \cdot \mathbf{I} / 3$$

$$\text{Mode} = \det(\mathbf{E} / |\mathbf{E}|)$$

(Criscione 2000)

Spherical Coordinates: $\{R_i\}$

$$R_1 = |\mathbf{D}|$$

$$R_2 = \text{FA}$$

$$R_3 = \text{mode}$$

Clinical DTI Applications: Model Parameters

- Changes in FA due to pathology
 - Really the mainstay of DTI applications
- Change in FA/trace relationship
 - E.g. Tumor Infiltration Index (Lu et al. '04)
- Less so: Connectivity around tumors
- Point: model parameters are reliably measured, biologically meaningful, clinically significant
- High-level point: don't lose track of why we do imaging and medical image analysis

Beyond the Single Tensor Model

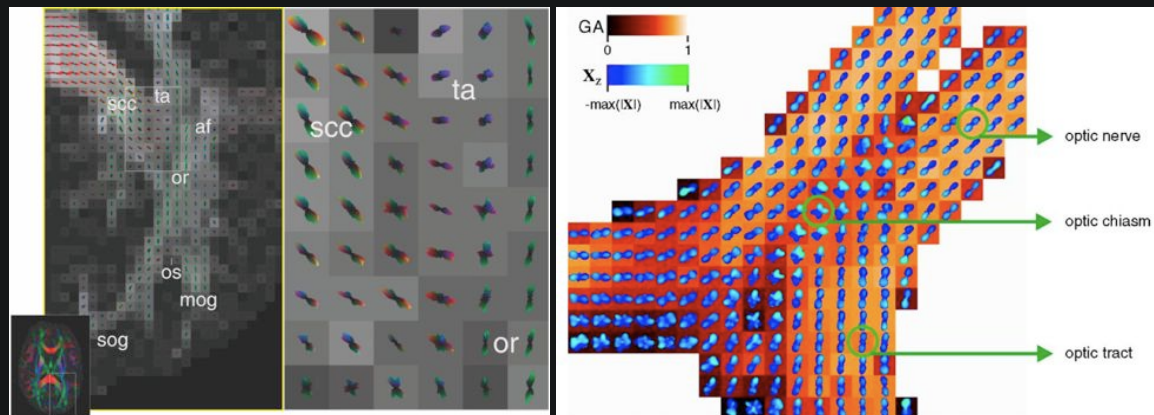

- Two (or more) Tensors

$$A_i = A_0(\alpha e^{-b\mathbf{g}_i^T \mathbf{D}_1 \mathbf{g}_i} + (1 - \alpha)e^{-b\mathbf{g}_i^T \mathbf{D}_2 \mathbf{g}_i})$$

- No model: Spherical harmonics
- Diffusion Orientation, Funk-Radon Transforms
 - ADC peaks != fiber directions
 - Fiber crossing resolution
- Tension with clinical applications

Associated visualizations

Ozarslan '06

Visualization as a data & model inspection

- Visualize **underlying** DWI data
 - How noisy is it?
 - Does data support complex analysis?
- Inspect relationship of DWI to single tensor model
 - Systematic errors highlight fiber crossings
- General ideas:
 - Use intuition of old (single tensor model) as **guide**
 - Use visualization to **illuminate** the path forward
 - Experience lends **perspective** to canned routines

Synthetic Data

- (again) using intuition about old as guide to new...

Synthetic Data

- (again) using intuition about old as guide to new...

ADC profile colored by single-tensor error

Synthetic Data

- (again) using intuition about old as guide to new...

ADC profile colored by single-tensor error

- How does it look in real data?
